

CANNABIS ANTI-AGING SECRETS

It's a sad fact that the anti-aging benefits of cannabis have been overlooked for too long. With so much focus on the supposedly evil psychoactive effects of THC, medical research into the numerous positive properties of the cannabis plant has been stifled. We've been unable to harness the contributions of cannabis for decades, but all that is changing.

The general population and the medical community at large are eager to see more research done to help us learn more about the advantages of using cannabis. Regulations are loosening due to overwhelming demand. And new studies are revealing multiple ways cannabis supports the aging process.

Conservative estimates of CBD use in the US over the next several years see 10% of adults, about 25 million consumers, using cannabis for therapeutic and cosmetic purposes by 2025. That's because **cannabinoids have valuable properties that offer a strong defense in the fight against aging.** And more and more products are being developed to harness these properties for consumer use.

Dozens of clinical trials confirm that cannabis effectively reduces visible signs of aging. And it's scientifically recognized that cannabinoids have the power to relieve some medical conditions related to age. Want more proof?

- Studies show that **using medical cannabis is safe for senior adults.** This demographic is probably most interested in fighting the debilitating signs of aging! The same research found dosing with tinctures, the preferred method of the seniors analyzed, to be highly effective and dependable.
- Cannabis maintains homeostasis. In other words, **cannabis regulates body systems** and encourages organs to work efficiently. This essentially delays aging processes.
- CBD works wonders in the fight against arthritis, which is not surprising since **it's a key ingredient for reducing pain and inflammation.**
- Cannabis **improves mental activity** and could delay dementia, with the potential to reverse aging mechanisms in the brain.
- Cannabinoids play a vital role in **preventing the breakdown of skin cells**, with possible medical uses that go far beyond allowing consumers to maintain a youthful appearance.
- Even **treatments to relieve incontinence** are being explored. Research into developing cannabis remedies for this common ailment is ongoing.

Is it any wonder that CBD and THC are the hot topics of the day? **Scientific evidence supporting the therapeutic value of cannabinoids is plentiful.** This has made cannabis a highly sought-after ingredient in personal care and wellness products. And even more medical uses are expected to follow.

We all want to be free of the debilitating effects and unattractive signs of aging. As the countless rewards of cannabis use are revealed, it's important to stay educated so we can reap the benefits.

Why Cannabis, and Why Now?

Is it any wonder that CBD and THC are the hot topics of the day? Scientific evidence supporting the therapeutic value of cannabinoids is plentiful. This has made cannabis a highly sought-after ingredient in personal care and wellness products. And even more medical uses are expected to follow.

We all want to be free of the debilitating effects and unattractive signs of aging. As the countless rewards of cannabis use are revealed, it's important to stay educated so we can reap the benefits.

The federal government reclassified industrial hemp with passage of the 2018 Farm Bill, and now products for personal wellness infused with CBD are everywhere. You can find everything from aromatherapy diffusers to pet treats, cosmetics and more, all promoting general wellness based on the potent properties of cannabis. Unfortunately, there have been a number of questionable allegations made as well.

To be clear, **cannabinoids are perfectly safe and healthy for use**, but suggestions that they diagnose, prevent, treat, mitigate, or cure disease go a bit too far. All dietary and herbal supplements, including those featuring cannabis compounds, are prohibited by the Food and Drug Administration from making such claims.

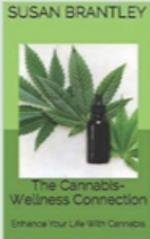

The truth is, though, cannabis-infused products CAN promote good health and wellness. And certain cannabinoid compounds actually do contain anti-aging benefits.

Of course, genetics, diet, exercise, illness and a host of other unknown factors play a part in the aging process. But capitalizing on cannabis, properly and responsibly, can only enhance your wellness at every stage of life.

Learn more about the anti-aging properties of cannabinoids and how to include cannabis in your personal care routines! In the upcoming ebook, *The Cannabis-Wellness Connection: Cannabis Anti-Aging Secrets Revealed*, you'll discover:

- **How cannabis promotes wellness and mitigates visible signs of aging**
- **The beneficial properties that give cannabis its anti-aging power**
- **How the best anti-aging treatments and cosmetics incorporate cannabis**
